Mebeloma cylindrosporum

Bukaryota; Fungi; Basidiomycota; Hymenomycetes; Homobasidiomycetes;

Agaricales; Cortinariaceae; Hebeloma.

I (bases 1 to 300)

Wipf,D., Benjdia,M., Tegeder,M. and Frommer,W.B.

Construction of a functional cDNA library from the ectomycorrhizal fungus Hebeloma cylindrosporum

Unpublished (2001)

/lab hose="E. Col; strain XL10-Gold, T1-resistant, F-"
/lab hose="E. Col; strain XL10-Gold, T1-resistant, F-"
/clone lib="Oxytricha plasmid UUGC10 library"
/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chamically-competent E. Coli XI10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWM92 (gi|473114|gp|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/clone lib="Coxytricha plasmid UUGC10 librazy"
/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWM42 (gi|4732114|gp|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

// Lone="Detail: PWD42N; Purified macronuclear chromosomal
// Note="Vector: PWD42N; Purified macronuclear chromosomal
// Now Oxytricha trifallax was blunt end-repaired with
// Lab NA polymerase and T4 polynucleotide kinase. Adaptor
// Coligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
// PWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible
// derivative of plasmid R1 The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gild732114 [gb]AF129072.1], a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     5

/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polynucleotide kinase. Adaptor
oligomotleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/clone libe "Oxytricha plasmid UUGCIO library"
/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent B. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Engrafting foreign replacement cells within a fetal non-human mammal, useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host.

Disclosure; SEQ ID NO 3; 48pp; English.

The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replace destroyed cells of the tissue. The method is useful for

32 protein of Geanorhabditis elegans or a functional equivalent,
derivative or bioprecursor of UNC-53. Also described: (1) a CDNA sencoding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a
encoding a vertebrate homologue of the C. elegans UNC-53 protein; (2) a
nucleic acid which hybridises to the cDNA of (1); (3) vector comprising
the CDNA as in (1); (4) a homologue cell containing the vector as in (3); (5)
a transgenic cell, tissue or animal comprising the vector as in (3); (5)
                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                     9
facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the
                                                                                                                                                                                                                                                                               1 GACGGATCGGGAGATCTCCCGATCCCCTATGGTCGACTCTCAGTACAATCTGCTCTGATG

```
a compound identified as an enhancer or inhibitor of the regulation of cell shape, motility, or the direction of cell migration for use as a therapeutic; (7) a method for determination of whether a protein is an inhibitor or enhancer of regulation of cell behaviour, growth, shape or expressing a homologue of UNC-53 and determining a change of phenotype; (8) a method for identification of vertebrate homologues of C. elegans unc-53 gene by hybridising a probe of 15-50 bp of the unc-53 sequence to a DNA library; and (9) a method for identification of a protein which is active in the signal transduction pathway of a cell of which a vertebrate homologue of UNC-53 is a component comprising; (i) contacting an extract of a cell with an antibody to the UNC-53 homologue; (ii) identifying an artibody/homologue complex; and (iii) analysing such a complex. UNC-53 is a signal transducing or signal integrator protein involved in controlling clientify any non-antibody protein bound to the complex. UNC-53 is a signal transducing or signal integrator protein involved in controlling directionality of cell migration and cell shape in C. elegans. Vertebrate homologues of UNC-53 can be used to promote neuronal regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        engrafting foreign replacement cell; implanting foreign replacement cell; growth; differentiation; drug development; vaccine development; tissue transplantation; human disease study; cytomegalovirus; gene; ds.

Engrafting foreign replacement cells within a fetal non-human mammal, useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host.

Disclosure; SEQ ID NO 4; 48pp; English.

The present invention describes a method for engrafting foreign replacement cells within a footal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells in the cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the specification

This is the nucleotide sequence of pCTM, a plasmid which contains a CMV promoter, a tripartite adenovirus leader flanked by T7 and SP6 promoters, and a multiple cloning site with a bovine growth hormone polyA site and downstream SV40 polyA site. It has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AM62465) and E2F transcription factor (see AM62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, profections, appecificatily canner (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the E2F promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-

This is the nucleotide sequence of pCTMIE, a plasmid that was constructed by amplifying the SV40 enhancer from SV40 viral DNA by PCR, digesting the maplified product with Ball and inserting into BamHI-digested plasmid pCMMIE has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoms protein (BP, see AAW82465) and E2F transcription factor (see AAW62444). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the E2F promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New fusion polypeptide of, e.g. transcription factor - used to treat, e.g. hyper-proliferative disease such as cancer and restenosis.

 This is the nucleotide sequence of pCTMI, a plasmid that was constructed from pCTM (see AAV40006) by digesting pCTM with XhoI and NotI and subcloning a 180 bp intron XhoI-NotI fragment from a pCMV-beta-gal vector. Plasmid pCTMI has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AAW62465) and E2P transcription factor (see AAW62461). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer used to treat hyperproliferative conditions, specifically cancer repressing transcription of the blander) or restenosis. They are more effective in repressing transcription of the E2P promoter than RB alone and cause cell cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct

commercially available vector pRc/RsV. Leader sequences and termination signals were introduced into the vector to allow for production of fusion proteins. The vector, pSfi/Not.Tagl, was modified to replace the pelb leader with the human immunoglobulin VHI leader sequence that permits the encoding of an SfiI cloning site without modification of the amino acid sequence. This fragment was then cloned as an EcoRI/Blunt-HindIII fragment into NotI/Blunt-HindIII cut vector pRc/RSV to give pVACI. The single chain Fv for an individual patient can be inserted within the VHI leader sequence. This plasmid when encoding a single chain murine

This sequence represents the vector pVAC1. This vector is based on the

Claim 10; Fig 7; 77pp; English.

```
The invention relates to a nucleic acid construct for delivery into living cells in vivo, to induce an immune response to a disease peptide antigen, where the construct directs expression of a fusion protein comprising the peptide antigen and the first domain of Frc. Also included are a nucleic acid vector comprising the above construct or vector and a method of producing a nucleic acid construct for inducing an immune response. The method comprises identifying a nucleic and sequence encoding a disease peptide comprises identifying a nucleic acid sequence, introducing the cloned nucleic acid into a vector nucleic acid sequence, introducing the cloned nucleic acid into a vector which allows the antigen to be expressed as a fusion with a first domain Frc from tetanus toxin, and optionally isolating the construct from the vector. The construct or vector is used as a vaccine to induce an immune response, particularly to tumour antigens. The present sequence is vector byACI which encodes a vaccine of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel nucleic acid construct for inducing an immune response in vivo to an antigen, capable of directing the expression of a fusion protein that comprises an antigen and an adjuvant sequence derived from a plant viral coat protein. The construct of the invention has cytostatic and virucide activity. The nucleic acid construct is useful for inducing an immune response in a patient, for vaccinating a patient against an infectious disease caused by an antigen derived from a pathogen e.g. a virus, for treating a cancer patient or a patient with a predisposition to cancer and for treating a patient naving a B cell malignancy, where the construct is encapsidated, and optionally, a second nucleic acid sequence encoding a further immunomodulatory colypeptide is administered to the patient. The construct is also useful in medical treatment, and in the preparation of a vaccine for treating or preventing a disease state associated with the antigen. The sequence shows the complete sequence of vector pWACI

The specification describes a microsphere comprising dihydrazide derivatised hyaluronic acid crosslinked to a nucleic acid (NA). The microspheres cause reduced inflammatory responses, and have increased safety and biodegradability. The microspheres are useful for transfecting a cell of a subject and for treating a subject having myocardial ischemia, by increasing cardiac angiogenesis. They are also useful for treating hemophilia. The present sequence represents the plaamid pCDNA3.1/Gs, into which is inserted a polynucleotide sequence which is crosslinked to hyaluronic acid. The polynucleotide sequence encodes a vascular endothelial growth factor (VEGF)

The invention provides a nucleic acid molecule (I) comprising at least the functional part of blasticidin resistance (BS) gene, or its homolog, linked through a recognition sequence to at least one selected gene. (I) is useful in treatment comprising:(I) providing cells/tissues transfected with (I); (2) surgical administration of the cells/tissues tronsfected with (I); (2) surgical administration of the cells/tissues tronsfected with (I); (2) surgical administration of the cells/tissues tronsfected by the patient. Therapeutic compositions comprising cells/tissues transformed with (I) is useful in identifying the role of genes in healthy and diseased tissue, in tissue engineering and in cosmetic surgery. Tissue engineering can be used to treat arthritis, joint replacement, skin grafts for burn victims, and replacement coronary arteries. Cosmetic tissue surgery includes rhinoplasty. The present sequence represents the nucleotide sequence of the vector pIRES/BS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   fusion protein; amyloid precursor protein; APP; transcription factor; notropic; neuroprotective; APP inhibitor; amyloid precursor protein inhibitor; Alzheimer's disease; beta-secretase; gamma-secretase; human; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a recombinant vector which comprises DNA, consisting of an insertion cassette contained between at least two insertion sites, that encodes a small nuclear (sn) RNA. The invention is used to identify snRNA modifications that inhibit expression of transcription products (and the identified snRNA are used to suppress expression) for delivering antisense sequences to the nucleus and to create transgenic animals. The present DNA sequence is human snRNA, Ul

CC The present invention describes a DNA molecule (I) that encodes a fusion

CC Transcription factor (IPF), fused in frame to the C-terminus of (I), a containing (I); and (3) methods for identifying a compound (A) that

CC containing (I); and (3) methods for identifying a compound (A) that

CC containing (I); and (3) methods for identifying a compound (A) that

CC containing (I); and (3) methods for identifying a compound (A) that

CC containing (I); and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (B) that

CC containing (I) and (3) methods for identifying a compound (A) that

CC containing (I) and (3) methods for identifying a compound (B) that

CC containing (I) and (3) methods for identifying a compound (B) that

CC containing (I) and (3) methods for identifying a compound (B) that

CC containing (I) and (B) and that and that and that

CC containing (I) and (B) and that and that and that

Submitted sequence has been edited to remove vector sequences 5' the insert, to correct miscalled bases and assign uncalled (N)
bases throughout the sequence, and to terminate when base-calling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryofta; Alveolata; Apicomplexa; Coccidia; Eimeriida; Cryptosporidium.

(http://sequence-www.stanford.edu/group/techdev/shear.htm)
The randomly sheared gDNA was chromatographed on sephacry1 S-400 to remove any small fragments and DNA eluting in the void volume was blunt-ended with T4 DNA Polymerase, treated with alkaline phosphatase to prevent the ligation of multiple fragments, ligated to Srf I-digested pCR-Script Amp (SK+) vector and transformed into E. coli strain Xil0 Gold. Recombinant clones from the first plating of the library were selected for sequence analysis using T3 and T7 primers."

/note="Vector: pQB-30MAST-attB (AY386205); Site 1: Sall;
Site 2: Not1; About 1 week after bolting, cDNA synthesis
site 2: Not1; About 1 week after bolting, cDNA synthesis
using Superscript'M-system (Invitrogen) with an
oligo(dT)-primer containing Not1 restriction site and a
Sall adapter. The main library (plate numbers begin with
1) of 38,000 clones was rearrayed into the sublibrary
(plate numbers begin with 201) containing 5,000 putative
expression clones. Average insert size is 1 kb. Note: The
rearrayed sublibrary (plate numbers begin with 201) was
sequenced. Library generation and sequencing was granted
in context of GABI-LAPP; data are also accessible at
https://gabi.rzpd.de"

Site_2: NotI; About 1 week after bolting, cDNA synthesis using SuperscriptThe system (Invitrogen) with an oligo(dT)-primer containing NotI restriction site and a SalI adapter. The main library (plate numbers begin with 1) of 38,000 clones was rearrayed into the sublibrary (plate numbers begin with 201) containing 5,000 putative expression clones. Average insert size is 1 kb. Note: The rearrayed sublibrary (plate numbers begin with 201) was sequenced. Library generation and sequencing was granted in context of GABI-LAPP; data are also accessible at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        96

```
times, larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional clouding, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryas sativa, Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,286 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/BST Resource Center (www.genome.clemson.edu)."
Earle, 1991). The relatively small genome of rice, three
